## Measure out glue and add the color.

Add the food coloring to the glue and mix well. Continue to add and mix until the glue is the desired color.

If needed, add glitter, fluorescent glow powder, or thermochromatic pigment. Be sure to thoroughly mix everything before adding the baking soda solution.

Add the saline solution.

Add 1 oz. of saline solution to the glue and mix well.

BLOG

## Add the baking soda and water solution.

While stirring, add 2 TBSP of the baking soda solution until completely mixed. The slime should now begin to form in the bowl and will become firm.

Once the solution is completely mixed, gently knead in the other 2 TBSP of the solution to the bowl. Add a little more saline if the slime is still too sticky.

## Add the final details.

Add the prepared water bead gels to the slime and mix with hands. Store in the jar when not in use.

A close-up photograph of a hand pulling a stretchy, blue, glittery slime. The slime is being pulled upwards, creating a long, thin strand that is covered in small, iridescent glitter particles. The background is blurred, showing a person wearing a red shirt.

ENJOY!
